ABSTRACT

The Department Of Defense (DoD) has consolidated the physical distribution functions for wholesale consumable material under the Defense Logistics Agency (DLA). As a consequence, service customers are worried that many repair parts that used to be geographically co-located would be moved to distant DLA supply depots. One DLA proposal is to stock material in a given geographic region if the demand in that region is above a certain percentage of system-wide demand. This study evaluates that proposal by looking at the demand of electronic items over a one-year period, during FY 92, in the Norfolk geographic region. Specifically, it compares transportation costs between maintaining the current DLA stockage policy and stocking all items at Defense Depot Norfolk. The study found that significant savings in second destination transportation costs can be achieved for those items that experienced at least 40% of their annual demand in the Norfolk area.

I. INTRODUCTION

A. BACKGROUND

Defense Management Review Decision (DMRD) 926 initiated the consolidation of Inventory Control Points (ICP) under the control of the Defense Logistics Agency (DLA) or consolidation within the services and the transfer of most of their consumables to DLA control. The Navy is expected to transfer over 270,000 of its consumables to DLA. As a direct result of DMRD 926 the Defense Logistics Agency (DLA) will soon manage the majority of repair parts and other consumables in the Defense Supply System. The services are concerned that when this happens DLA will not be able to provide the customer service levels that existed prior to the transfer. One issue in this concern has to do with positioning of consumable inventories near the customers. As a consequence, DLA is presently attempting to develop a procedure which can be used to determine where to physically locate this material.

A thesis research project was completed in December 1993 by LT Scott Thon which examined the current DLA stockage practice for several items of interest to the Navy. Thon's research concluded that, "the current DLA stockage policy is non-optimal because stock is neither closest to the customer nor to the vendor" (Thon 1993). Based on his research, the recommendations he made included further study of the DLA wholesale inventory model because of the shortage of material on hand to satisfy high priority requisitions, and that DLA should use historical demand as its basis for stocking material within geographic regions. (Thon, 1993)

In the interest of substantiating the research completed by LT Thon, and providing further research data for DLA to consider as they continue to develop a stockage location policy, a followup thesis project was completed in June 1994 by LT Gary Murphy. His study examined the feasibility of a

proposal by the DLA to stock material close to the customer based on percentage of the total annual demand for an item generated by customers located within the same geographic region. LT Murphy focused on the San Diego geographic region with his study of DLA managed electronic material.

B. OBJECTIVE

This thesis parallels the research of LT Murphy. This study focuses on the Norfolk geographic region and its objective is to provide information relevant to determining the feasibility of stocking material close to the customers in that region based on the percentage of total annual demand. Since Norfolk and San Diego are the east and west coast locations of the largest number of customers within a geographic region, this complements and completes the analysis of siting of electronic material in support of the Navy's major needs.

C. ASSUMPTIONS AND LIMITATIONS

Following LT Murphy's approach to the analysis, this thesis stratifies demand of electronics repair parts over different ranges, from 100 percent down to 40 percent, and makes recommendations on where to physically locate material based on demand, weight, cost, and transportation requirements associated with the Norfolk region.

As with LT Murphy's thesis, this research project was limited to electronic type material managed by Defense Electronics Supply Center (DESC). This material was chosen because it is representative of industrial-type consumable material managed by DLA. Industrial material has the most effect on the readiness of the services. (Hanks, 1990)

This thesis used data from the DLA requisition history file for Fiscal Year 1992 (FY 92). The data does not include the full effects of the consumable item transfer directed

under Defense Management Review Decision (DMRD) 926 since the transfer was approximately 50% completed at the end of FY 92.

During FY 92 service depots still managed an intermediate level of DLA material. However, this inventory is being disestablished as a consequence of DMRD 901. Because the two supply depots studied in Murphy's and this thesis, NSC (now FISC) San Diego and NSC (now FISC) Norfolk, continued to support the geographic customers with intermediate level support during FY 92, the lack of local support from the DLA wholesale system is probably understated. The two local NSC's provided numerous DLA managed items to geographic customers and then ordered replacement inventory from out-of-area DLA wholesale warehouses.

From a database of over 17 million requisitions the data was stratified by percent demand in the geographic region. A total of 26,009 individual requisitions were examined which represented all requisitions for items that experienced forty percent or more of their total demand in the Norfolk geographic region, including requisitions by the fleet. The largest savings experienced were for the 40% and higher range. The savings margin decreases below the forty percent level but the savings is still substantial due to the high volume of activity in the Norfolk area. Because of the small savings percentage in the San Diego area, lower percentage levels were not considered in LT Murphy's study. The savings percentage in the Norfolk area of requisitions in the 39% and below range will be an interesting area of study, especially in comparison with the San Diego area. This study focuses on the Norfolk area and parallels LT Murphy's. Therefore, the lower percentages will not be considered in this study either. However, the 0% to 39% range consisted of approximately an additional 40,000 requisitions which could profitably be the subject of a future study.

D. PREVIEW

Chapter II gives background information on the Defense Management Review Decisions (DMRD) that created the present situation and why DLA's stockage policy has become very important to the services. It also details DLA's current stockage policy which is the basis for this research as well as the previous two thesis.

Chapter III details the methodology the author used in his investigation. The analysis begins by looking at Navy requisitions in the Norfolk area for FY 92. After extracting the requisitions relative to the Norfolk geographic area an attempt was made to determine the transportation charges for out-of-area shipments of those items to the Norfolk area. Finally, it provides the methodology the author used to determine transportation charges under the current policy and what those charges would be if the items were stocked in Norfolk.

Chapter IV presents an analysis of the information derived from the FY 92 data. It is presented by demand percentage groups, ninety-nine to ninety, eighty-nine to eighty, seventy-nine to seventy, sixty-nine to sixty, fifty-nine to fifty, and forty-nine to forty, of Navy demand as compared to total DoD demand for FY 92. It will show that transportation costs would be reduced considerably if all electronic repair parts with demand at the forty percent and greater levels were assumed to be stocked at a single storage site in Norfolk.

Chapter V summarizes the research, presents conclusions, and recommends steps DLA should use to implement a policy of stocking material based on percentage of system demand.

II. BACKGROUND

A. DEFENSE MANAGEMENT REVIEW DECISIONS

The collapse of the Soviet Union and the break up of the Warsaw Pact countries caused the end of the cold war and significantly decreased the external threat to the United states. In any business the objective is to minimize costs or maximize profits while conducting operations in the most efficient and effective manner possible. This applies even more so to the conduct of the affairs of a nation. Congress and the Executive Branch of our government focused their attention on how much defense was needed to maintain an adequate defense posture based on the threat reduction and how much of a reduction in defense spending could be absorbed without affecting military readiness.

In 1985 President Reagan appointed the Packard Commission and directed them to evaluate the Department of Defense (DOD) and determine how to reduce costs while improving services. After extensive study the commission issued a report called the Defense Management Review (DMR) report which was a set of separate and complete decisions regarding DOD. The decisions contained specific recommendations to accomplish cost reductions and improve readiness that were identifiable as a result of the end of the cold war. In conjunction with the completion of the study and prior to President Reagan being able to direct its implementation President Bush assumed the presidency. In 1989 after considerable study and thought he directed DOD to implement the recommendations of the Defense Management Review report (Berube, 1992, p. 2).

There were several decisions issued by the commission. However, there are three major decisions that affect stock positioning. They are DMRD 901, DMRD 902, and DMRD 926.

1. DMRD 901

This decision directed DOD and the services to review current operating practices and procedures, and find ways to reduce supply system costs. Several initiatives were identified by the Office of the Secretary of Defense which were expected to achieve a significant level of cost savings. The initiative that was to have the greatest affect on cost saving was the elimination of intermediate level inventories. Another point of importance and a focus of this study was the suggestion to stock material closest to the vendor rather than the customer.

2. DMRD 902

This decision required the initiation of actions to consolidate the supply distribution depots of all services under the management of the Defense Logistics Agency (DLA). This decision consolidates 24 buildings with 100,844,000 gross square feet and 25,700 employed personnel, and was implemented on 16 March 1992. Ultimately the savings derived from this consolidation will be achieved through the optimization of DOD storage capacity and efficient warehousing. After placing all sites under the management of the Defense Logistics Agency (DLA) the development of a Standard Automated Data Processing (ADP) system for distribution operations, reduced operating costs, and reduced transportation costs tailored to the new system are mandatory to reap maximum savings. Successful implementation will yield savings in the form of reduced overhead and administrative support, merging of duplicate inventory items, centralized packing, increased consolidated shipments, reduced transportation costs, and will maximize the use of all facilities. (Riley, 1992, p. 6)

3. DMRD 926

This decision addressed the question of just how many inventory control points (ICP) were needed to support DOD's logistics requirements. At the time of this decision the

Navy, Air Force, Army, and DLA managed 20 major ICP's and stored material in 34 different Depots. The commission recommended the ICP's remain flexible. This was accomplished by directing each service to retain their cognizant ICP's. However, their inventory management responsibilities were drastically reduced by shifting the material management of 981,000 consumable items to DLA. (Hekman, 1990, p. 23) The Navy's share was 335,000 items out of 485,000. Specialized consumables used in nuclear propulsion, subsafe/level I, strategic weapons systems, or selected parts deemed engineering or safety critical were not transferred. The actual number of Navy managed NSN's transferred to DLA between 1 August 1991 and 1 June 1994 was expected to be approximately 155,000 (Aramowicz, 1992, p. 34). The actual number of NSN's transferred as of 21 March 1995 is 244,932. This information was obtained through a phone conversation between CDR Robert L. Schwaneke, DLA Headquarters, and Professor Alan W. McMasters, Naval Postgraduate School.

B. DMRD CONCERNS

DMRD 902 and 926 expanded DLA's control over the purchase, storage, distribution and shipment of consumable items (Andrew, 1992, p. 17) The primary concern that accompanies this expansion and shifting of consumable management to DLA is that customer service levels would be adversely affected. Customers were afraid that material would be moved to geographic locations much farther away and thus increase delivery time. A study conducted in March 1991 by the Naval Supply Systems Command indicates that costs will increase by 19% for demand based items if no longer stocked closest to the customer. Also of great concern was the effect on the level of readiness this shift in management would have even though it had been predicted to be minimal. (Castillo, 1991, p. 12).

The Logistics Management Institute performed a study for the Air force titled "How DLA's Supply Performance Affects Air Force Readiness", (Hanks, 1990). The study concluded that it is important that a link be established between DLA's supply performance and Air Force readiness. This is even more important now that DLA manages the majority of DOD consumables. In addition, such a study should be conducted for each service because of the inherent differences in the services. Periodically a similar updated version of the study should be conducted as a means of keeping track of the trend of improvement or failure (Hanks, 1990).

C. DLA STOCKAGE POLICY

A policy is a definite plan of action that sets the course of present and future decisions. Stockage policy refers to how and where inventory materials are positioned. The objective of any stockage policy should be to minimize the sum of first and second destination transportation costs, inventory holding and ordering costs, backorder costs, and processing costs. An inventory system should also strive to maximize customer service. These two objectives conflict since, for example, maximum customer service is achieved by stocking a large quantity of an item close to the customer, or spending lots of money to get speedy delivery if the inventory is located somewhere else. Thus, some tradeoff between these objectives is needed.

In order to minimize transportation costs and maximize customer service both the concept of positioning inventories closest to the customer and closest to the vendor have been considered by DOD.

1. Background

DLAM 4145.10 of August 25, 1978 (p. 2-3), established DLA's policy of locating stock closest to the customer,

Least cost outbound transportation involves stock positioning to minimize the distance and the time for delivery of material surface mode, from DLA distribution points to the requisitioner's ship-to-address. This concept has been determined to be the most effective for stock positioning in support of CONUS geographic area demands. It involves basically a long haul in and a short haul out in overall depot distribution missions wherein distance from depot to customer is given more consideration than distance from procurement source to depot for depot stock replenishment.

A policy letter from DLA in 1984 in support of the concept in DLAM 4145.10 stated, "We can accomplish this objective (of minimizing transportation costs) by positioning items as close to the source of demand as economically and operationally possible using both DLA and military service locations." (Cassity, 1984)

DOD Instruction 4140.7 of June 7 1985 directed the Integrated Material Manager (IMM) to determine the locations and number of units of items that are to be stocked at each location. The primary instrument at his disposal to assist him in making this decision is the Uniform Material Movement and Issue Priority System (UMMIPS). UMMIPS provides "a ready basis for expressing the relative rank of requisitions and material movement transactions. The principle of this system is to ensure that greater management attention and resources are dedicated toward material requirements that impact essential mission completion". The IMM as directed by DODINST 4140.1-R, will use UMMIPS to the greatest extent possible to design supply support systems and allocate resources. (DODINST 4140.1-R, 1993, p. 5-18)

The IMM has to consider the following factors in accordance with DODINST 4140.7 in order to make the best decision:

- a. Frequency of demand, and forecasting reliability;
- b. Dollar value, weight, and cube;

c. Inventory carrying costs (i.e., the added costs to receive and store at a greater number of locations) plus costs of multi-destination versus single destination shipments, and first destination transportation costs to multiple location versus savings in responsiveness and second destination transportation costs;

d. Specialized requirements such as depot level maintenance programs and maintenance unique test and inspection repair, packaging, storage, and transportation to include second destination transportation costs from depots to customers;

e. Wartime plans, desirability of stock disposal and mobilization requirements.

Given these factors, the first priority is that stock normally shall be positioned at the wholesale distribution facility (primary stock point) closest to the point of use (customer), or appropriate embarkation point for overseas shipment consistent with the capability of the facility. Secondly, the IMM's decision may not be the optimal solution for the minimization of transportation costs (DODINST 4140.7).

In the late 1980's a contradiction to the policy of stocking material closest to the customer was posed. The basis for this contradiction was the possibility that if material was stocked closest to the vendor the money the government could save would be significantly greater than stocking closest to the customer. In accordance with DMRD 901, DLA's Operations Research and Economic Analysis Office (DORO) conducted four studies on the two possibilities.

The first study, "Bulk Stock Location Study", was completed in June 1991 (Jernigan, 1991). The study concluded that a potential saving of 10.5 million (FY 88 dollars) annually could be achieved by stocking closest to the vendor. It was determined that the DLA's 1988 stockage strategy of locating stock closest to the customer was not the most

economical policy. The study noted that the following factors were not considered in that policy:

(1) The differences in the expense of first destination transportation costs between vendors and depots;

(2) The operational differences between the depots, as captured by internal item handling costs (Jernigan, 1991, p. xi).

The "closest to the customer" policy does not consider the high cost impact of out-of-area shipments in support of high priority requisitions. When these costs were included the "closest to the customer" policy was found to be more expensive than the "closest to the vendor" policy. However, unless special requirements in a formal manner are placed on vendors, customer service will be the element sacrificed.

The recommendations of this study were not implemented because the project was overcome by the DMRDs and DOD depot consolidations.

The second study, "Primary Distribution Site (PDS) Location Analysis", was completed in August 1991 (Bertrand, 1991). This study provided an analysis of alternative methods of consolidating DOD supply depots. The assumptions made in this study were the basis of assumptions made by LT Murphy in his thesis, and the author of this thesis. The assumptions are; (1) a demand-based stockage policy should be used where each site serves all customers in an assigned area exclusively, with no out-of-area shipments; and (2) it is assumed that the workload at non-PDS sites would be half that of the PDS.

This study resulted in DLA management adopting and implementing a method for managing consolidated depots using Primary Distribution Sites (PDS). The study determined how many PDS's there should be and where they should be located. The results of this analysis indicated that a three PDS configuration consisting of Mechanicsburg/New Cumberland PA,

Memphis TN, and Tracy/Sharpe CA, provided the lowest total logistics costs while not overly exceeding the sites' capacities to process the workload.

The third study, "Stockage Location Policy Analysis", (Hobbs and Lanagan, 1992) investigated alternative stockage policy costs under the assumption of three PDS's. This study found the "closest to the vendor" stockage policy is potentially more economical than a "closest to the customer" policy for items whose geographic demands are dispersed. Effects on military readiness (service to the customer) were not considered in this study. The final study, "Comparative Cost and Support Pattern Analysis for High Demand Navy Customers Under a Single Site Storage Option", (Lanagan and Noll, 1993) was conducted to address two concerns raised by the Navy. The Navy was concerned that many of the items scheduled for transfer to DLA management under the consumable item transfer (CIT) program would not be stocked near large Navy demand areas. The other area of concern was the elimination of the Navy's intermediate retail level stocks for DLA managed items and where those items were to be positioned in the future. DLA also used this study to try and develop a "rule of thumb" for deciding when it was more cost effective to store a category of items near a Navy location based on the Federal Supply Class (FSC).

This was the only study that included Navy retail demand data. Prior to this study only DLA wholesale material was used. The results indicated that Norfolk is the "least cost" location for all DLA material used by Navy customers by approximately \$9 million annually as compared to the next best site (Susquehanna). Likewise the "least cost" solution for the west coast was San Diego by approximately \$20 million over San Joaquin (Tracy/Sharpe). These results are based on comparative transportation costs employing a single site stockage strategy of stocking the material at San Diego or

Norfolk vice San Joaquin or Susquehanna and do not reflect facility efficiencies. The study was unable to develop a single "rule of thumb" based on FSC due to different physical characteristics (weight, cube, shelf-life, etc.) within and across FSCs.

DOD recently updated its stockage policy in DOD Instruction 4140.1-R, "DOD Material Management Regulation", of January 1993. The provisions of the policy follows below:

1. Policy

a. Wholesale and retail stockage within the DOD supply system shall be used only when it is essential to maintain military readiness and sustainability or is economically justified.

b. Maximum use shall be made of direct vendor delivery and commercial distribution systems.

c. Items justified for stockage will be positioned so as to maximize customer responsiveness while minimizing the aggregate stockage, distribution, and transportation costs.

(1) Items shall be positioned to maximize support of approved mobilization and emergency war plans.

(2) To the maximum extent possible, stocked items should be positioned such that a given customer is supported from the minimum number of wholesale distribution centers and/or lower level supply activities.

(3) Items shall be positioned to minimize the aggregate inbound and outbound transportation costs, unnecessary long-distance shipments, crosshauling, and circuitous routing, and to maximize shipment consolidation and the efficient use of transportation resources.

d. When selecting a specific distribution center for an item of supply, consideration will be given to:

(1) Item characteristics such as its designation as a controlled inventory item, shelf-life item, hazardous item, or an item requiring special maintenance and/or inspection requirements, to ensure that adequate security, safety, storage environments, technical expertise, and test equipment exist at the candidate distribution centers.

(2) Projected customer demand patterns, missions, consolidations and transportation hubs.

(3) The diversity, locations, volume, and stability of supply sources for an item including new item contract sources, and organic and contract repair sources.

e. The decision to stock an item and positioning of items that are stocked shall be reassessed, at a minimum, once every 12 months. Changes in mobilization plans, missions, weapon systems, deployments, item characteristics, customer demand patterns, and/or sources of supply may necessitate more frequent assessments.

2. Procedures

a. Material management activities shall maintain documentation that provides the rationale/justification for the decision to stock an item within the DOD supply system.

b. The item manager of an item of supply will maintain source and customer demand frequency information by item to aid in stock positioning decision process.

c. The Defense Logistics Agency will provide inventory control points with an overall stock positioning concept plan. The plan shall be developed based on the policy guidance in paragraph c., (1), (2), (3). The stock positioning concept plan shall identify the preferred distribution sites by class of material.

d. The item manager will identify the distribution sites and the stockage level for each site. Stockage of the item will be based on the policy guidance in paragraph d., (1), (2), (3) and, to the maximum extent possible, within the overall stock positioning concept plan provided by the Defense Logistics Agency. The Inventory Control Point will document the rationale for stockage decisions that are not consistent with the overall stock positioning concept plan.

e. The Defense Logistics Agency shall to the maximum extent possible position items in accordance with the Inventory Control Point selected sites. When the Inventory Control Point site selection does not fall within the Defense Logistics Agency stock positioning concept plan the Defense Logistics Agency and the Inventory Control Point shall negotiate to arrive at a final selection.

f. When the decision is made to change the stockage location(s) of the item, the material at the original location(s) shall be removed by attrition and new deliveries

of the item shall be to the new stockage location(s). Redistribution shall be the course of last resort and used only when economically justified. (DODINST 4140.1-R, 1993, p. 4-19 to 4-20)

2. The Defense Logistics Agency's Proposed New Policy

As a result of the Defense Logistics Agency's Operations Research and Economic Analysis Office (DORO) studies and in the interest of complying with the requirements of DODINST 4140.1-R, DLA implemented a "Best Value to the Customer" stock positioning policy. This strategy combined with a priority driven decision model (which is discussed in LT Thon's thesis) is used to maximize customer responsiveness while minimizing the aggregate stockage, distribution, and transportation costs. (Moore, 1993, p. 1)

DLA's priority driven stockage strategy is designed to accommodate physical item characteristics and customer demand patterns. Each priority acts as a screen to filter out NSN's which meet specialized stockage criteria. Each priority is defined by the four logical classes in Figure 1.

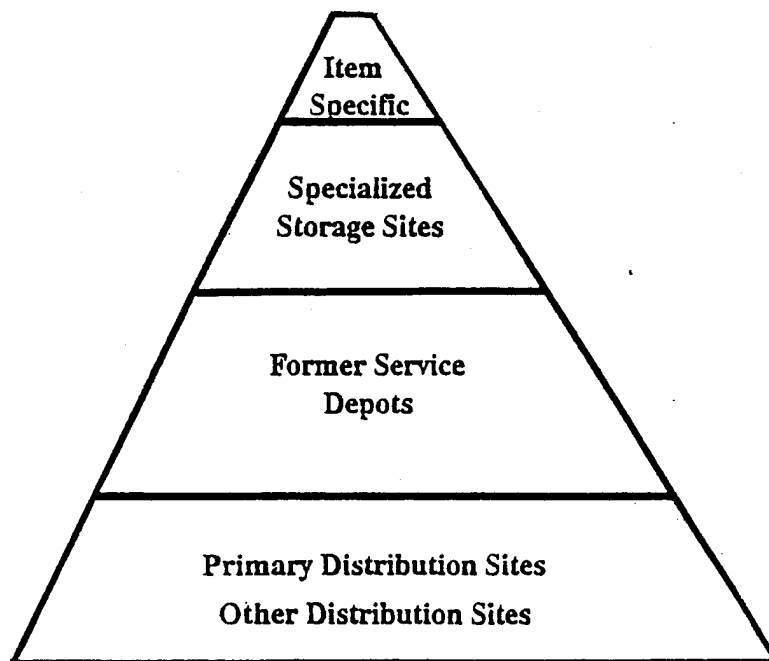

Figure 1

The following is an explanation of each class:

1. ITEM SPECIFIC: This group is an "exception" category that is reserved for individual items that have unique positioning requirements, such as Fleet Ballistic Missile (FBM) or Strategic Defense Items, and is intended to be used sparingly. About five percent of the items will fall into this category.

2. SPECIALIZED STORAGE SITES: Specialized storage is determined based on the categorization of each individual NSN's characteristics. Attributes such as whether or not an item is hazardous, requires specific facilitization or handling equipment, or has been selected by the cognizant Inventory Control Point (ICP) for special handling. This group is expected to consist of about ten to fifteen percent of total items.

3. FORMER SERVICE DEPOTS: This group's categorization was based on material readiness and were considered essential to serving that purpose prior to the end of the cold war. This is the category on which this thesis is concentrated. This material is that which should be located "closest to the customer" either because certain customers are significant users of the item, or the material is critical for mission performance. There are three sub-categories within this category used for determination of item applicability, the first is demand-based, the second is based on maintenance of/and weapon systems criticality, and the third is based on agency agreements between the services and DLA during the Consumable Item Transfer (CIT) process. The demand-base portion of the policy has three qualifiers: (1) Determined by the percentage of total system demand, which is the focus of this thesis; (2) Based on a stable quantity ordered by customers, if a minimum quantity is ordered over a specified period of time then the item is stocked in the local PDS; (3) Based on service unique applicability. If only one service

uses the item, then the item is stocked in the area that supports that service's unique mission.

4. PRIMARY DISTRIBUTION SITES: This group's categorization represents the DLA's default stockage policy. It includes all of the remaining items that do not fall into one of the other categories.

A determination will be made by comparing the automated distribution frequency (ADF) against a system parameter (variable). It is anticipated to consist of approximately forty-five to seventy percent of the total NSN's. Active items are stocked at the most productive high volume facilities (PDS) to minimize unit costs. These items have a wide customer base with limited or no significant regional demand pattern. The inactive items are stored at the remaining facilities to fully utilize the capacity of the these facilities (other distribution sites).

This new policy officially recognizes the possible benefits that should be realized from the DORO studies and establishes three types of storage depots: Primary Distribution Sites (PDS), Specialized Distribution Sites (SDS), and Satellite Warehouse Sites (SWS). However, the latter two classifications are not mutually exclusive. An individual storage depot may be assigned all three at one time. Additionally, the number of depots that are assigned a particular classification will fluctuate over time from no depots to every depot.

PDS locations are distribution facilities designed for high volume mechanized support specifically to provide global support for general commodities. A minimum number of sites have been designated as PDS, only Susquehanna and San Joaquin at present, but possible additions are being considered.

SDS sites support customer requirements on a regional basis, and/or provide global support for material which requires specialized equipment, facilities, or training. As

a regional support facility the SDS will be meeting military service customer readiness needs and providing the required industrial support required by maintenance depots. There are three ways an NSN can qualify for stockage at a particular SDS:

1. A certain percentage of the total system sales volume usually occurs in the immediate geographic vicinity (within 100 miles).

2. An NSN will be stored at an SDS if a certain minimum quantity are routinely demanded and used within the geographic area.

3. An NSN will be stored at an SDS if it is designated as weapon system or maintenance critical and the item manager and customer have determined that in order to be responsive the material must be collocated with the customer (Moore, 1993, p. 1-2).

Although SDS's were established to support customer requirements on a regional basis they may also be designated to provide global support for materials that have certain specific or unique characteristics. If it is determined by proper authority that the item characteristics mentioned above affect the distribution depot's operational or facilitization requirements, and it is determined that these requirements could be more cost effectively handled than a decision to concentrate stockage at a few specific sites, permission to do so may be given.

SWS facilities warehouse material that moves slow or is inactive as determined by annual demand frequencies (ADF). They are also designated as facilities that perform high volumes of processing material returns, reconditioning and repackaging items, and conducting authorized repairs.

NSN's are stocked in a minimum number of depots. Therefore, a maximum number of depots can be negotiated between DLA and the services on an item by item basis

regardless of the minimum number of qualified sites. If the maximum limit is reached before all the quantity of a buy has been allocated, the residual amount will be placed as stock using the default storage location logic; to wit, active items go to the PDS with the highest Percent Recurring Demand Allocation (PRDA) and inactive items go to other designated depots.

The DLA stock positioning policy is designed to provide quality customer service subject to a given constraint. This thesis develops proposals for implementing one portion of this program, the stockage of material based on percent of total demand.

III. METHODOLOGY

A. PREVIEW

This chapter explains the procedures used to answer the question of whether savings can be realized by locating material in the same geographic location based on that area receiving a certain percentage of the material's total annual demand. This chapter first explains how the DLA demand data was stratified in order to obtain a sample that could be analyzed. Then an analysis by percentage of annual demand was conducted on the requisitions required in the Norfolk geographic area. This included determining methods of shipment. An examination of shipping commands and the modes used was conducted in doing that. Finally, an in-depth analysis was conducted to determine transportation savings or loss, based on the present cost of transportation versus the proposed method of transportation when an entire inventory is shifted to Norfolk.

B. DATA STRATIFICATION

The data was obtained from the DLA requisition history file for Fiscal Year 1992. Stratification and analysis of the data was completed using SAS Statistical Software and the assistance of computer user services manager, Dennis Mar, operating an IBM Virtual Machine/Conversational Monitor System (VM/CMS), and run on an AMDAHL 5995 mainframe computer, located in the W. R. Church Computer Center at the Naval Postgraduate School in Monterey, CA.

The first step in the data analysis procedure was to stratify the sample in order to work with a manageable number of NSN's. LT Murphy chose to analyze electronic items due to his concern regarding the readiness of fleet units. Electronic material has a great affect on material readiness and should be treated as a priority with regards to customer

demand. To parallel the analysis by LT Murphy only commodity "E" material was extracted from the original data base (commodity "E" material consists of electronic items). LT Murphy's thesis presented a detailed analysis of the San Diego area. This thesis presents a detailed analysis of the Norfolk area focusing on commodity "E" material.

C. NORFOLK FY 92 NSN DEMAND PERCENTAGE

The original Defense Logistics Agency (DLA) requisition history file for Fiscal Year 1992 contained 17,205,790 records. By focusing on just commodity "E" material the number of records was reduced to 2,355,774. The sample was further stratified by looking at only Navy requisitions located in the Norfolk geographic area. In order to obtain Navy demand in the Norfolk geographic area only those requisitions for FY 92 with a "V" (East Coast Navy Commands), or "N" (Navy shore command), in the first position of the requisition number and with a shipping zip code of 233XX, 234XX, 235XX, 236XX, or 237XX were kept. This sample contained 27,330 NSNs.

The next step in analyzing the Norfolk data was to examine the NSNs contained in the requisition history file to determine the percentage of total demand for each NSN that the Navy requested in the Norfolk geographic area. This data was further divided into the total number of units demanded for the year. The categories used were four; 1-25, 26-50, 51-100, and greater than 100. Table 1 shows the results of this analysis.

| % DEMAND | TOTAL | % | 1to25 | % | 26to50 | % | 51to99 | % | >100 | % |
|----------|-------|-------|-------|-------|--------|-------|--------|-------|------|-------|
| 100 | 3132 | 11.46 | 2981 | 95.18 | 74 | 2.36 | 35 | 1.12 | 42 | 1.34 |
| 90 to 99 | 20 | .07 | 8 | 40.00 | 5 | 25.00 | 2 | 10.00 | 5 | 25.00 |
| 80 to 89 | 150 | .55 | 99 | 66.00 | 16 | 10.67 | 22 | 14.67 | 13 | 8.67 |
| 70 to 79 | 206 | .75 | 155 | 75.24 | 22 | 10.68 | 13 | 6.31 | 16 | 7.77 |
| 60 to 69 | 586 | 2.14 | 478 | 81.57 | 56 | 9.56 | 27 | 4.61 | 25 | 4.27 |
| 50 to 59 | 2225 | 8.14 | 2054 | 92.31 | 87 | 3.91 | 44 | 1.98 | 40 | 1.80 |
| 40 to 49 | 663 | 2.43 | 489 | 73.76 | 77 | 11.61 | 50 | 7.54 | 47 | 7.09 |
| 30 to 39 | 2014 | 7.37 | 1772 | 87.98 | 115 | 5.71 | 63 | 3.13 | 64 | 3.18 |
| 20 to 29 | 3485 | 12.75 | 3068 | 88.03 | 211 | 6.05 | 101 | 2.90 | 105 | 3.01 |
| 10 to 19 | 5150 | 18.84 | 4287 | 83.24 | 401 | 7.79 | 218 | 4.23 | 244 | 4.74 |
| 00 to 09 | 9699 | 35.49 | 7024 | 72.42 | 903 | 9.31 | 625 | 6.44 | 1147 | 11.83 |
| TOTAL | 27330 | | 22415 | 82.02 | 1967 | 7.20 | 1200 | 4.39 | 1748 | 6.40 |

Table I. Norfolk Area Demands (Number of Units Demanded)

The total column shows how many different NSN's fell into each of the percent (%) of demand categories. The following four columns then indicate the amount and percentage of units demanded during the fiscal year for each of these NSNs. The results show that 3132, or 11.46% of the items had 100% of total system demand and 25.54% of the items had 40% or more of their demands at the Norfolk area. The majority of these items (82.02% of all percentage categories) had total annual demand of less than 26 units. If an NSN has a total demand of less than 26 units in a year that suggests the importance of commodity "E" material to the material readiness of the ordering operational commands in the Navy since it was probably ordered based only on immediate need.

D. SHIPPING MODES DATA

The next step was to determine how the material was shipped to the customer. Appendix A shows the mode of shipment codes used in the Department of Defense (DOD). Table II provides a breakdown of

all the shipping modes for the Norfolk area requisitions. This table was developed by determining the mode of shipment (see column one) used for the first requisition under each separate NSN.

The "all items" column identifies the number of items transported per mode, the first "percent" column identifies the percentage of all items shipped by that mode, the "100% items" column identifies the breakdown by mode of the number of items demanded 100% in the Norfolk area, the second "percent" column identifies the related percentage of 100% items shipped per mode.

As LT Murphy noted, choosing the first requisition of each NSN accurately reflects the entire data base. This approach was validated by the author of this study. An analysis of the number and percentages of shipping modes is depicted in Table II.

Table II shows that only 1.9% of the items were shipped from local sources (shipping mode 9) and only 3.5% of the items that had 100% of the total system demand in the Norfolk area were shipped from local sources. Comparing columns three and five of the table shows that the percentage of items shipped by each mode is basically the same as when 100% of the demand is in the same geographic region with the exception of mode A. Clearly DLA was not following any sort of percent of system demand criterion when deciding where to stock material.

The most common method used to deliver material was surface-small package carrier (shipping mode 5) which accounted for 50.7% of the total. The second most common method was by truck (shipping modes A and B) which consisted of 38.9% of the total. The third most common method was air-small package carrier (shipping mode J) which consisted of 5.2% of the total.

| MODE | ALL ITEMS | PERCENT | 100% ITEMS | PERCENT |
|-------|--------------|---------|---------------|---------|
| A | 5684 | 20.9 | 216 | 7.0 |
| B | 4874 | 18.0 | 377 | 12.2 |
| G | 220 | 0.8 | 29 | 0.9 |
| H | 417 | 1.5 | 66 | 2.1 |
| J | 1405 | 5.2 | 243 | 7.9 |
| N | 22 | 0.1 | 4 | 0.1 |
| P | 3 | 0.0 | 0 | 0.0 |
| Q | 178 | 0.7 | 22 | 0.7 |
| R | 1 | 0.0 | 1 | 0.0 |
| S | 2 | 0.0 | 0 | 0.0 |
| T | 8 | 0.0 | 1 | 0.0 |
| U | 43 | 0.2 | 7 | 0.2 |
| X | 7 | 0.0 | 1 | 0.0 |
| 2 | 1 | 0.0 | 0 | 0.0 |
| 3 | 1 | 0.0 | 0 | 0.0 |
| 4 | 3 | 0.0 | 2 | 0.1 |
| 5 | 13747 | 50.7 | 2003 | 65.0 |
| 7 | 15 | 0.1 | 1 | 0.0 |
| 9 | 502 | 1.9 | 109 | 3.5 |
| BLANK | 196 | 0.0 | 50 | 0.0 |
| TOTAL | 27329 | 100.0 | 3132 | 100.0 |

Table II. Shipping Modes for the Norfolk Area

The next step was to examine which commands were shipping the material to Norfolk customers and which modes they used. Table III summarizes this data. The table shows how many items, by shipping mode, were shipped by either a DLA depot, a Navy depot, or some other services's depot. Most of the material from the DLA depots was shipped from the Tracey/Sharpe, Ogden, Mechanicsburg, and Richmond sites. The main Navy shippers were Norfolk, Oakland, and San Diego. A complete list of shippers is shown in Appendix C.

This table shows that 94.57% of the items were shipped from DLA depots. This was to be expected as the data base includes only those items that are passed to DLA item managers for issue.

| MODE | DLA | % | NAVY | % | OTHER | % | TOTAL |
|-------|-------|--------|------|-------|-------|--------|-------|
| A | 5682 | 99.96 | 0 | 0.0 | 2 | 0.04 | 5684 |
| B | 4815 | 98.79 | 0 | 0.0 | 59 | 1.21 | 4874 |
| G | 43 | 19.55 | 34 | 15.45 | 143 | 65.00 | 220 |
| H | 306 | 73.38 | 5 | 1.20 | 106 | 25.42 | 417 |
| J | 1281 | 91.17 | 7 | .50 | 117 | 8.33 | 1405 |
| N | 0 | 0.0 | 0 | 0.0 | 22 | 100.00 | 22 |
| P | 0 | 0.0 | 0 | 0.0 | 3 | 100.00 | 3 |
| Q | 173 | 97.19 | 0 | 0.0 | 5 | 2.81 | 178 |

| S | 0 | 0.0 | 0 | 0.0 | 2 | 100.00 | 2 |
| T | 7 | 87.50 | 1 | 12.50 | 0 | 0.0 | 8 |
| U | 0 | 0.0 | 0 | 0.0 | 43 | 100.00 | 43 |
| X | 1 | 14.29 | 0 | 0.0 | 6 | 85.71 | 7 |
| 2 | 1 | 100.00 | 0 | 0.0 | 0 | 0.0 | 1 |
| 3 | 0 | 0.0 | 0 | 0.0 | 1 | 100.00 | 1 |
| 4 | 3 | 100.00 | 0 | 0.0 | 0 | 0.0 | 3 |
| 5 | 13276 | 96.57 | 0 | 0.0 | 471 | 3.43 | 13747 |
| 7 | 15 | 100.00 | 0 | 0.0 | 0 | 0.0 | 15 |
| 9 | 58 | 11.55 | 0 | 0.0 | 444 | 88.45 | 502 |
| TOTAL | 25661 | 94.57 | 47 | .17 | 1426 | 5.26 | 27134 |

Table III. Shippers of NSN's to Norfolk Area Customers

The first two rows of Table IV aggregates the shipping modes used by DLA. The third row is for items delivered from local sources.

| MODE | NORFOLK | % | TOTAL |
|--------------|---------|------|-------|
| AIR(DLA) | 2030 | 7.4 | 2030 |
| SURFACE(DLA) | 24527 | 89.7 | 26557 |
| OTHER | 576 | 2.1 | 27133 |
| UNKNOWN | 197 | .7 | 27330 |

Table IV. Norfolk Shipping Modes Summary

E. PROCEDURES USED FOR PERCENT ANALYSIS

The 27,330 NSN's for the Norfolk area were analyzed by each individual requisition for each of the previously stated percentage of demand levels. The individual NSN's from the Norfolk analysis were studied in depth to determine what transportation savings, if any, could be saved by stocking these items in Norfolk. This study assumes that there would be one DLA stock site, Defense Depot Norfolk, for the items. This was done for the ninety-nine to ninety, eighty-nine to eighty, seventy-nine to seventy, sixty-nine to sixty, fifty-nine to fifty, and forty-nine to forty, percentage levels of total system demand. Each requisition contains various data elements required to be completed when submitting and processing requisitions. These data elements were used extensively in the analysis of the data. The data elements are: (a) Document number; (b) Depot shipped from; (c) Mode of shipment; (d) Priority of the requisition; (e) Requisition quantity; (f) Zip Code to where the material was delivered; and (g) Weight of the item. It was assumed that the 100% level would be stocked where the demand was located (i.e., Norfolk). This would generate 100% savings in transportation costs for those items.

Transportation costs consist of both first destination charges (from the vendor to the depot) and second destination charges (from

the depot to the end-use customer). First destination charges for transportation were assumed to be the same whether items were stocked at the present DLA depot or stocked at the Norfolk site. LT Thon showed that several items had multiple vendors and DLA's choice of vendors was not based on closest to the vendor nor closest to the customer policy (Thon, p. 70). This suggests that first destination transportation charges are not presently considered by DLA item managers when selecting vendors.

Current DOD instructions direct that items requisitioned under priority one, two, or three should be shipped via air transport in order to conform to the Uniform Material Movement and Issue Priority System (UMMIPS) timeframes. It is assumed all services are in compliance with this directive. (DODINST 4410.6, p. 4)

The next step was to estimate the secondary destination charges for each individual requisition in the less than 100% category. There are three transportation categories into which a requisition can fall; namely, (1) local, (2) surface, or (3) air. To compare transportation costs, it is assumed that all local transportation costs would be equal so a transportation cost of zero was assigned to any requisitions shipped by local mode. If a surface mode was used the transportation rate was assumed to be represented by the Roadway Package Service (RPS) rates shown in Appendix B. The surface cost determination needs a zone. The zone was determined using the location of the shipping depots, as shown in Appendix C, the Zip Code of the receiving activity, and the RPS Zip Code Zone Charts (Roadway, 1995).

When transportation by air mode was used, the transportation rate was assumed to correspond to the Federal Express (FEDEX) rates in Appendix D. The majority of material shipped by air was transported via air-small package carrier and the FEDEX rates are representative of this industry.

The results of the study are shown in Appendixes E through J and will be discussed in the next chapter. The following two flow charts show the procedure used to determine current transportation

cost (Figure 2), and the procedure used to determine the estimated transportation costs if all items were stocked at Defense Depot Norfolk (Figure 3).

The present method of determining transportation costs estimates is if the mode is local, (mode 9) meaning it is stocked at the ICP and no transportation costs are involved to acquire the material, the transportation cost is zero. If the mode is not local then the weight of each item requested is multiplied times the requisition quantity to obtain the total weight. This total weight is then used with the RPS or FEDEX tables to determine transportation costs.

The proposed method of determining transportation costs is if the zip code of the requesting command is 233XX, 234XX, 235XX, 236XX, 237XX, then the mode is considered local and the cost is zero. If the mode is not local then the weight of each item requested is multiplied times the quantity to obtain the total weight. A specific code or verifiable need must justify FEDEX shipment of requisitions such as an emergency request code 999. Requisitions are screened for the proper priority code before FEDEX shipment is authorized. Those requisitions with priority code 1-3 are shipped by air (FEDEX) while those requisitions with priority codes 4-15 are shipped by surface mode and the transportation rate is in accordance with RPS shipment charts.

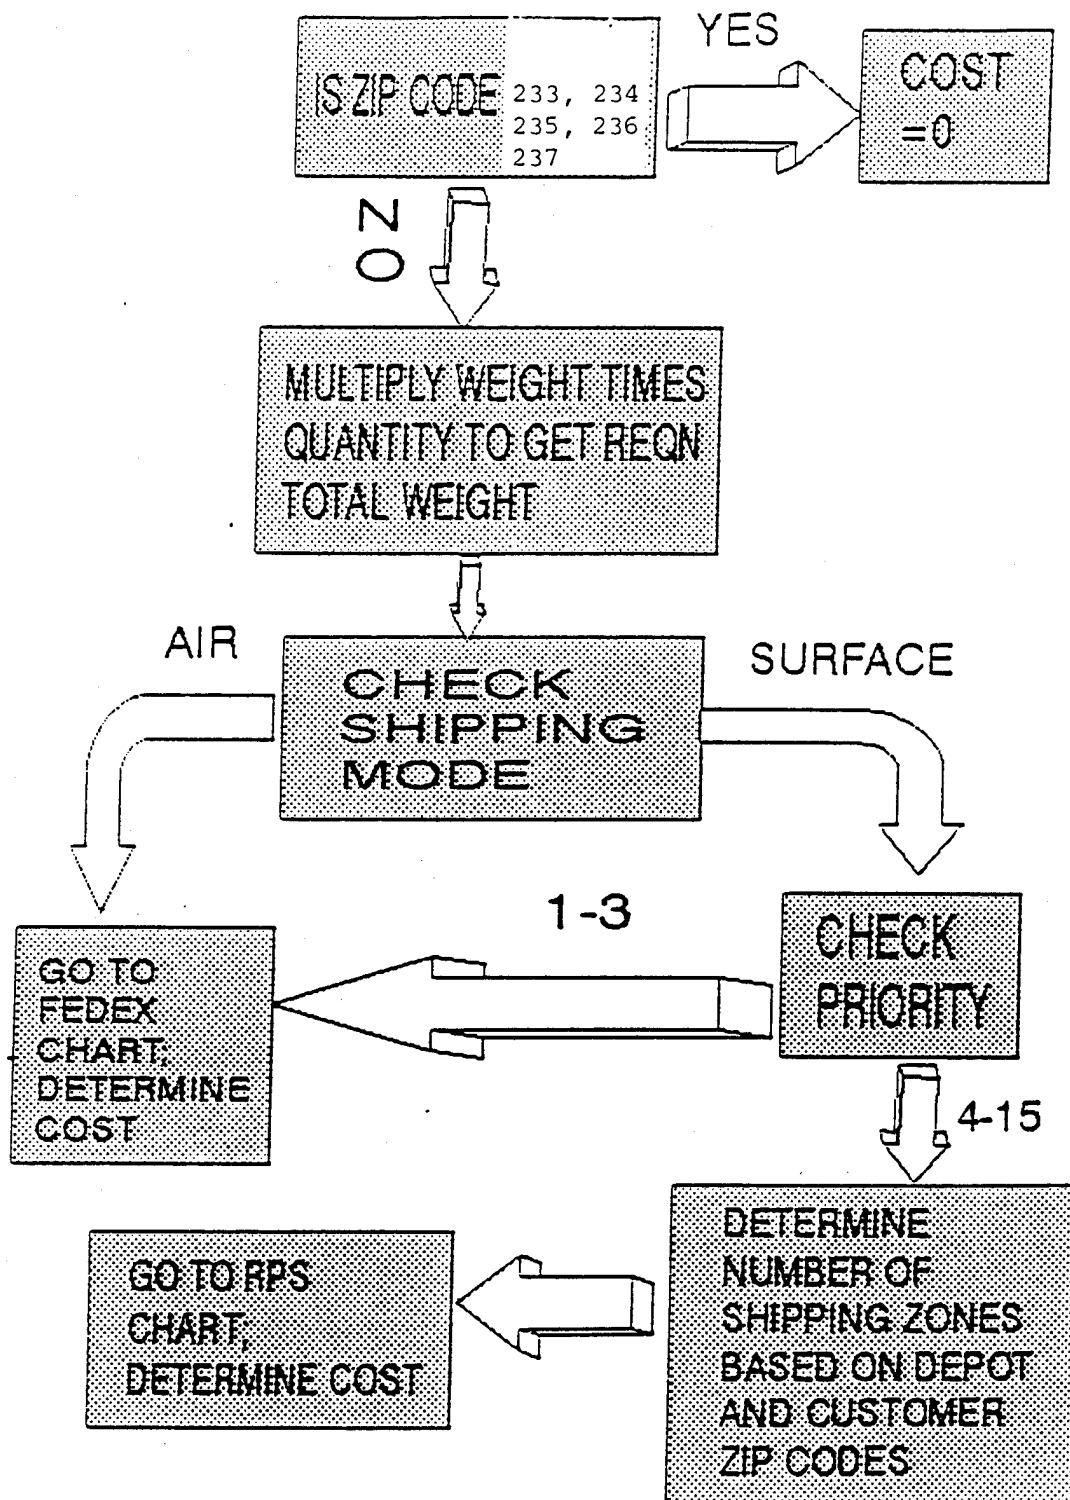

Figure 3. Flow Chart for DLA Norfolk
Estimated Transportation Cost

IV. DATA ANALYSIS AND INTERPRETATION

A. GENERAL OBSERVATIONS

The analysis of the DLA shipping modes for the requisitions shipped to the Norfolk geographic area is an indication of the present DLA stockage policy. As stipulated in the policy DLA does not stock material in a geographic area based on percentage of units demanded. This section will give an explanation as to whether it would be a good policy to stock material based on percentage of demand and at what percentage level that should be done basing the analysis on the Norfolk area.

Combined with Murphy's study, the analysis and interpretation of the Norfolk data will provide a complete set of data for both west coast and east coast for FY 92 from which to analyze transportation costs. Murphy's general observations stated below have been found to be completely applicable in this Norfolk area study.

One important point to remember is that most of the data was prior to completion of DMRD 926, the consumable item transfer to DLA. DLA is now in charge of the physical distribution of all wholesale material and manages most of the wholesale consumables at former service depots. This could allow DLA to place material closer to the customers, or leave material at the service depot where it was located in 1992. If DLA decides it is in its best interest to further reduce current stockage levels of items that are major contributors to material readiness of the fleet and are currently acquired expeditiously from former service depots the impact on customer service must be carefully considered (Murphy, 1994).

There was a total of 26,009 individual requisitions examined in this study. The number of units requested in a requisition ranged from a low of 1 to a high of 2,270. Very few of these requisitions were filled from local sources. The

main reason was the Navy was still providing intermediate level support and most of the requisitions examined were to replenish intermediate stockage levels.

There were three major factors that influenced the amount of savings obtained from stocking all NSN's in the same geographic location as the majority of demands. The first was the number of separate requisitions against an individual NSN. The second was the shipping weight. Since most of the material in the electronics commodity group weighs less than one pound, the unit shipping cost was found to be similar regardless of the number of items ordered on an individual requisition. However, the marginal cost decreases for each additional pound shipped and is reflected in the transportation rates.

The third driving factor was the priority of the requisitions. The cost of air transportation is much greater than the surface mode. If an item that required shipment by air were located near the customer the air cost could be avoided and total transportation costs could be reduced dramatically. Also, as the percent of local demand for those items increases, the number of items that require air transportation decreases if there is local accessibility.

Over 90% of the items that experienced more than ten requisitions during FY 92 are presently stocked at more than one location. The two main locations for most of this material are Defense Depot Ogden and Defense Depot Richmond.

The analysis of requisitions in the 40% to 90% range follows. The statistical results are listed in Appendix E through J. The 100% demand analysis is not included in the appendix because locating those items where they are demanded will yield 100% savings in transportation costs. There were 4,726 requisitions involving 3,132 NSN's in the 100% category (for a complete listing of these NSN's contact Professor Alan McMasters, Naval Postgraduate School). The total savings

possible was found to be \$85,995.25 if the material had been located at Norfolk.

The data from the FY 92 was stratified by NSN and then the in-depth analysis was completed. In completing the analysis various factors were discovered that warranted the elimination of certain requisitions from the analysis, such as missing data entries, items which were transported by means other than surface or air modes, and destinations which were outside CONUS. Eliminating these requisitions did not have a negative effect on the accuracy of the analysis. However, their elimination from the appendices may give the incorrect appearance that certain NSN's should fit into a higher percentage level.

The appendices have eight columns and the transportation cost computational steps were those described in Figures 1 and 2. The first column identifies the "NSN"; the second column identifies the "requisition quantity"; the third column (POSTPRES) identifies the "present mode of shipment"; the fourth column (PRESTRAN) identifies the "present cost of transportation" (based on Figure 1); the fifth column (POSTPROP) identifies the "proposed mode of shipment"; the sixth column (PROPTRAN) identifies the "proposed cost of transportation" (based on Figure 2); the seventh column identifies "savings or loss"; the eighth column identifies the "percentage level". An example of this procedure is provided.

In the 90 Percent Analysis, NSN 5935011624096 was requisitioned on 18 occasions (see first page of appendix E). Quantities requisitioned range from 1 to 70 units. Each unit requested weighs considerably less than one pound. However, in computing transportation costs the minimum weight is one pound. Therefore, the requisition for 70 units is charged at the weight of one pound as is the requisition for 1 unit. The items were shipped via surface or air modes from Defense Depot Mechanicsburg to Norfolk at a surface cost of \$14.59 and an

air cost of \$15.50. If the item was stocked in the Norfolk area a total savings of \$252.58 could be achieved.

B. 90 PERCENT ANALYSIS

A total of 20 items experienced 90% to 99% of their demand in the Norfolk geographic region. There were a total of 323 requisitions submitted against these 20 items. Very few of these requisitions were filled from local Norfolk sources. The analysis comparing each requisition's present transportation costs with those "proposed" costs if the material was stocked in Norfolk is shown in Appendix E. The analysis shows that majority of these items would have had reduced transportation costs if stocked locally. The total savings would have been \$5,385.96.

If all items were stocked in Norfolk, 80% of the requisitions would have been shipped via surface and would incur no transportation costs because they fit local (mode 9) criteria. Therefore, the cost would be zero under proposed conditions. From the analysis of this data the author concludes that all items that have 90% or more of their demand in the Norfolk area should be positioned at Defense Depot Norfolk.

C. 80 PERCENT ANALYSIS

A total of 150 items experienced between 80% and 89% of their demand in the Norfolk geographic region. There were a total of 1112 requisitions submitted against these items. The analysis comparing a requisition's present transportation costs with those "proposed" costs if the material was stocked in Norfolk is shown in Appendix F. The data shows that items would have reduced transportation costs if stocked locally. The total savings would have been \$16,234.78.

If all items were stocked in Norfolk, 80% of the requisitions would have been shipped via surface and would

incur no transportation costs because they fit local (mode 9) criteria. Therefore, the cost would be zero under proposed conditions. From the analysis of this data the author concludes that all items that have 80% or more of their demand in the Norfolk area should be positioned at Defense Depot Norfolk.

D. 70 PERCENT ANALYSIS

A total of 206 items experienced between 70% and 79% of their demand in the Norfolk geographic region. There were a total of 1356 requisitions submitted against these items. The analysis comparing a requisition's present transportation costs with those "proposed" costs if the material was stocked in Norfolk is shown in Appendix G. The data shows that items would have reduced transportation costs if stocked locally for a total savings of \$16,911.14.

The total transportation cost under present conditions was significantly higher than under the proposed conditions. As with the 90% and 80% analysis there would have been significant savings in transportation funds if the percent demand policy was followed.

If all items were stocked in Norfolk, 75% of the requisitions would have been shipped via surface and would incur no transportation costs because they fit local (mode 9) criteria. Therefore, the cost would be zero under proposed conditions. From the analysis of this data the author concludes that all items that have 70% or more of their demand in the Norfolk area should be positioned at Defense Depot Norfolk.

E. 60 PERCENT ANALYSIS

A total of 586 items experienced between 60% and 69% of their demand in the Norfolk geographic region. There were a total of 3222 requisitions submitted against these items. The

analysis comparing a requisition's present transportation costs with those "proposed" costs if the material was stocked in Norfolk is shown in Appendix H. The data shows that items would have reduced transportation costs if stocked locally for a total savings of \$35,145.37.

The total transportation cost under present conditions was significantly higher than under the proposed conditions. As with the 90%, 80%, and 70% analysis there would have been a significant savings in transportation funds if the percent demand policy was followed.

If all items were stocked in Norfolk, 85% of the requisitions would have been shipped via surface and would incur no transportation costs because they fit local (mode 9) criteria. Therefore, the cost would be zero under proposed conditions. From the analysis of this data the author concludes that all items that have 60% or more of their demand in the Norfolk area should be positioned at Defense Depot Norfolk.

F. 50 PERCENT ANALYSIS

A total of 2225 items experienced between 50% and 59% of their demand in the Norfolk geographic region. There were a total of 8459 requisitions submitted against these items. The analysis comparing a requisition's present transportation costs with those "proposed" costs if the material was stocked in Norfolk is shown in Appendix I. Due to the enormity of data contained in this analysis the first five pages are printed in their entirety and the remaining data is summarized by NSN. The summarization is categorized by NSN, the total number of requisitions submitted (REQNO), total quantity requisitioned during the year (REQQTY), and Savings. The data shows that items would have reduced transportation costs if stocked locally for a total savings of \$66,436.68.

The total transportation cost under present conditions

was significantly higher than under the proposed conditions. As with the 90%, 80%, 70%, and 60% analysis there would have been a significant savings in transportation funds if the percent demand policy was followed.

If all items were stocked in Norfolk, 90% of the requisitions would have been shipped via surface and would incur no transportation costs because they fit local (mode 9) criteria. From the analysis of this data the author concludes that all items that have 50% or more of their demand in the Norfolk area should be positioned at Defense Depot Norfolk.

G. 40 PERCENT ANALYSIS

A total of 663 items experienced between 40% and 49% of their demand in the Norfolk geographic region. There were a total of 6811 requisitions submitted against these items. The analysis comparing a requisition's present transportation costs with those "proposed" costs if the material was stocked in Norfolk is shown in Appendix J. Again, to the enormity of data contained in this analysis the first five pages are printed in their entirety and the remaining data is summarized by NSN. The summarization is categorized by NSN, the total number of requisitions submitted (REQNO), total quantity requisitioned during the year (REQQTY), and Savings. The data shows that items would have reduced transportation costs if stocked locally for a total savings of \$35,482.83.

The total transportation cost under present conditions was significantly higher than under the proposed conditions. As with the 90%, 80%, 70%, 60%, and 50% analysis there would be significant savings in transportation funds if the percent demand policy was followed.

If all items were stocked in Norfolk, 75% of the requisitions would have been shipped via surface and would incur no transportation costs because they fit local (mode 9) criteria. Therefore, the cost would be zero under proposed

conditions. From the analysis of this data the author concludes all items that have 40% or more of their demand in the Norfolk area should be stocked at Defense Depot Norfolk.

H. SUMMARY

The amount of transportation savings that could be reaped in the Norfolk area is very substantial. The Norfolk local geographic region was defined as the area which includes zip codes 233, 234, 235, 236, and 237. Therefore, transportation costs for shipments within this region are assumed to be zero under the proposed policy. Those items that could not be obtained within the region were acquired via air or surface modes from other depots. Interestingly, less than 10% of all requisitions were acquired via air.

Contrary to LT Murphy's study of the San Diego area, the results of this analysis show that very substantial savings can be achieved if items were stocked in the Norfolk area. His analysis shows a declining savings trend from the 100% to the 40% levels. Finally, he showed a completely negative benefit if items below 40% demand were relocated under the single site option. This Norfolk analysis shows substantially increased overall benefit at the same levels, and savings increase until the 40% level was reached. At the 50% level in this study total savings are \$66,436.68 while in LT Murphy's study of the San Diego area the total savings were \$914.04. At the 40% level in this study total savings are \$35,482.83 while in LT Murphy's study the total savings were \$444.94. When analyzing why there is such a substantial difference in savings the ratio of the number of requisitions is the first consideration. The ratio of requisitions being generated in Norfolk versus San Diego is 3:1. However, even when compensating for the difference in ratio, the savings benefit in Norfolk is far greater than in San Diego. Future studies of Norfolk requisitions below 39% should be interesting.

V. SUMMARY, CONCLUSIONS, AND RECOMMENDATIONS

A. SUMMARY

As previously stated in Chapter I this thesis is a follow-on study. The data provided completes study and analysis of DLA's stock location policy using data from fiscal year 1992 for the east and west coast for electronic material. The main objective of this study was to examine the DLA stock location policy and determine whether stocking items in the Norfolk geographic region based on percent of system demand would result in transportation savings. A second objective was to try and determine at what percentage of system demand this policy should be in place. The research was done assuming a single stockage site.

Chapter II provided background information and discussed the history of the Defense Management Review Decisions (DMRDs) and their effect on the military. The changes initiated were the elimination of intermediate level inventories, the assumption of all physical distribution operations by DLA, and the transfer of item management of most consumables to DLA. DLA implementation of these changes is based on a priority driven stockage strategy. Customer demand patterns and physical item characteristics which are the basis of the strategy were identified and explained.

Chapter III provided an overview of how DLA was stocking and transporting electronic items during fiscal year 1992. This information was extracted from DLA's Defense Integrated Data Bank. All items ordered by customers in the Norfolk area were researched and evaluated separately to examine transportation costs. About 70% of the requisitions were shipped via surface mode and about 30% were shipped via air. The method of transportation for the requisitions shipped was assumed to be via RPS or FEDEX. Also, the method used to determine if percent demand criteria would have resulted in

lower transportation costs was described. The analysis was completed by determining the second destination transportation charges under DLA's present stock location policy and determining what these charges would have been if all of the items were stocked in Norfolk.

Chapter IV evaluates the results derived using the methodology explained in Chapter III. The two main factors affecting the cost comparison were the number of separate requisitions against an item and the priority of the requisitions. It then provides the results of the comparison between stocking at current DLA depots and the proposed shift to stocking at Defense Depot Norfolk at each of the different percentage levels; forty to forty-nine percent, fifty to fifty-nine percent, sixty to sixty-nine percent, seventy to seventy-nine, eighty to eighty-nine percent, ninety to ninety-nine percent, and one-hundred percent of total demand for an item coming from the Norfolk region.

B. CONCLUSIONS

There are several conclusions that can be drawn from this thesis. DLA's present stock location policy is neither closest to the vendor nor closest to the customer. There were many occurrences of an item being needed in the Norfolk region but not being stocked locally.

Electronic items do not weigh very much. Most items weigh much less than one pound. Therefore, the total number of requisitions against an item is a very significant factor. As heavier stock items are analyzed the savings can be expected to increase.

The analysis in this thesis show that it is more cost efficient to store material closest to the customer given a certain percentage of system demand. The results are much stronger in favor of closest to the customer for even the 40 percent category at Norfolk than was the case for San Diego.

C. RECOMMENDATIONS

1. DLA should implement their policy of stocking material in the Norfolk geographic region based on percent of system demand by the Navy in that region.

The analysis shows evidence in every instance from 90 percent demand to 40 percent demand that it would be less expensive to stock all of the items in the Norfolk area than the present policy. A reduction in delivery times to the customer would also be an added benefit.

2. Additional research is required.

Because of the large savings obtained even at the 40 percent level at Norfolk, it would be appropriate to investigate low percentage levels for Norfolk.

Only historical data for electronic material from FY 92 was used. As a result of my research I fully agree with LT Murphy's recommendation. It was that "before any policy changes are made it is recommended that demand over a longer period, perhaps three years, be used to better ensure a proper indication of demand patterns" (Murphy, 1994, p. 2).

Other stock items of the Federal Supply Classification categories should be studied. The results of the analysis of heavier material are expected to show even more savings than the electronic material.

APPENDIX A: MODE OF SHIPMENT CODES

| <u>CODE</u> | <u>EXPLANATION</u> |
|-------------|--|
| A | Motor, Truckload |
| B | Motor, Less Than Truckload |
| C | Van |
